

## Data Science

- Data science: multidisciplinary  $\rightarrow$  uses scientific methods, Algorithms, Statistics, Visualisation, extract info from structured, Unstructured data.

- Big data: collection of data i.e, Volume, Variety, Veracity, Velocity, Value (SVs)  
 $\downarrow$   
 Uncertain & Inconsistency.

$\rightarrow AI > ML > NN > DL$ .

$\rightarrow$  Data types and Scales:-

Data types:- structured, Unstructured, semi structured, Quasi structured  
 (Teachal data + inconsistency)

:- Cross-sectional data - Time series data - Panel data

$\downarrow$   
 Many variables  
 collected same time  
 or duration

$\downarrow$   
 Single variable  
 collected several  
 times (week, month)

$\downarrow$   
 Several variables  
 collected several  
 times. (Ex: Unemployment  
 rate of countries)

$\rightarrow$  Object; Attributes:- Qualitative

Attributes:- Nominal - Binary - Ordinal - Continuous and discontinuous

- Numeric: (Interval, Ratio scales).  $\rightarrow$  Quantitative.

Nominal :- Name of things - Name of symbols: Ex: Lecturer, White, Professor.

Ordinal :- Values with meaningful sequence (Ranking) Ex: Medium, High, Low.

Binary :-  
(Yes/No)  $\left\{ \begin{array}{l} \text{Symmetric: Both values are equal Ex: Gender} \\ \text{Asymmetric: Both values not equal Ex: Result.} \end{array} \right.$

Numerical :- Real/integer value, measure quantity.

$\left\{ \begin{array}{l} \text{Interval-scaled: Difference of adjacent values consistent: Ex: Temperature,} \\ \text{- No predefined starting point (True zero value) Dates.} \\ \text{Ratio-scaled:} \end{array} \right.$

$\left\{ \begin{array}{l} \text{- Difference of adjacent values Ex: Height, weight, Length.} \\ \text{- Predefined True zero value No zero in difference of Height.} \end{array} \right.$

Continuous :- Infinite values, measured, subdivisible, Float Ex: Height, weight, time.

Discontinuous :- Specific values, counted, non subdivisible Ex: No. of students, No. of cars.

8  $\Rightarrow$  Population :- set of possible observations

Sample :- Logical subset of the population.

8. Measures of centrality :-

1. Mean :

$$\mu = \frac{\sum x}{N} = \frac{x_1 + x_2 + \dots}{N}$$

2. Weighted mean

3. Median

$$= \frac{n+1}{2}$$

4. Mode :

most often occurs.

# Types of Data Analytics :-

## 1. Descriptive

- Summarize historical data to identify patterns
- Used Aggregate functions on database.

## 2. Predictive

- Predicts future
- Predict probability of future occurrences
- Ex: Regression, Classification

## 3. Prescriptive

- Choose optimal actions to perform on insights from Descriptive and predictive analytics
- Ex: Linear programming, Meta-heuristics Alg.

## § Steps in Data Science:

Step 1: Setting Research goal :-  $\left\{ \begin{array}{l} \text{Define research goal} \Rightarrow \text{Well defined, Deliverable} \\ \text{Create project charter} \Rightarrow \text{Objectives, Resources, Timeline.} \end{array} \right.$

Step 2: Retrieving Data :-  $\left\{ \begin{array}{l} \text{Internal Data Ex: Servers.} \\ \text{External data Ex: Facebook} \end{array} \right. \rightarrow \left\{ \begin{array}{l} \text{Data retrieval} \\ \text{Data owner.} \\ \text{- ship} \end{array} \right.$

Step 3: Data Preparation: (Preprocessing).

Step 4: Data Exploration :-  $\left\{ \begin{array}{l} \text{Simple graphs} \\ \text{Combined graphs} \\ \text{Link and brush} \\ \text{Non-graphic Techniques} \end{array} \right. \begin{array}{l} 1. \text{Histogram} \\ 2. \text{Scatter plot} \\ 3. \text{Box plot} \\ 4. \text{Pie chart} \\ 5. \text{Bar.} \end{array}$

Step 5: Build the model :-  $\left\{ \begin{array}{l} \text{Model selection} \\ \text{Model execution} \\ \text{Diagnosis and model comparison.} \end{array} \right.$   
$$MSE = \frac{1}{n} \sum (y - \hat{y})^2$$

Step 6: Presentation and Automation :-  $\left\{ \begin{array}{l} \text{Presenting Data} \\ \text{Automating Data Analysis} \end{array} \right.$
